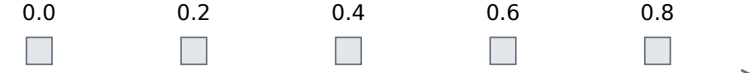
Same graph. Same number of real calls. Different observations.



A

Global image 0 → Global image 2

B

Global image 0 → Local crop of image 0

Eligibility uses image 0 and past state; image 2 content does not select the crop.

No local proposal: use global image 2.

Two real calls per 0.8-s block.

Only measured positions can complete a passage. Same-image detections are fused before one tracking update.
